Use Case Specification: UC-24

- **ID / Code:** UC-24
- **Use Case Name:** Configure Notification Triggers
- **Description:** Allows an Administrator to create, edit, enable/disable and delete custom rule-based notification triggers (e.g., invoices more than N days overdue, outstanding balance above X €), defining recipients and channel.
- **Primary Actor:** Administrator
- **Scope:** Subscription Management & Invoicing System
- **Level:** User Goal
- **Stakeholders & Interests:**
  - *Administrator:* Wants proactive alerts adapted to operational needs (FR-4.3).
  - *Company (Product Owner):* Wants to reduce overdue debt and detect risks early.
- **Preconditions:** The Administrator is authenticated and has notification configuration permissions.
- **Postconditions:** The rule is stored and active/inactive as configured.
- **Success Guarantee:** The rule is saved with condition, threshold, recipients, channel and frequency, and is evaluated by UC-23 from its next execution.
- **Minimal Guarantee:** Invalid rules are never saved; legally required notifications (FR-4.1) cannot be disabled through custom rules (Assumption).
- **Trigger:** The Administrator selects "Notification rules".
- **Main Success Scenario:**

1. **Administrator:** Requests to create a notification trigger.
2. **System:** Displays the rule editor: condition type (days overdue, outstanding balance, account standing…), threshold, recipients, channel (email/SMS) and frequency.
3. **Administrator:** Defines the rule and saves it.
4. **System:** Validates the rule (valid threshold, existing recipients, no duplicated rule).
5. **System:** Shows a preview of how many records currently meet the condition.
6. **Administrator:** Confirms and activates the rule.
7. **System:** Stores the rule and logs the change.

- **Extensions:**
  - 1a. Administrator edits, disables or deletes an existing rule:
    - 1a1. System loads the rule; changes are validated and logged as in steps 4–7.
  - 4a. Invalid or duplicated rule:
    - 4a1. System indicates the problem; the flow resumes at step 3.
