Use Case Specification: UC-18

- **ID / Code:** UC-18
- **Use Case Name:** Export Accounting Package
- **Description:** Allows an Administrator to generate and manage monthly or quarterly export packages (e.g., VeriFactu, CSV data management, ZIP) for the external accounting service, with versioning when regenerated and full export audit (UR-2.7, FR-6.3, FR-6.11).
- **Primary Actor:** Administrator
- **Scope:** Subscription Management & Invoicing System
- **Level:** User Goal
- **Stakeholders & Interests:**
  - *Administrator:* Wants to deliver complete, correct accounting data and manage CSV/package exports with minimal manual work (UR-2.7, FR-6.11).
  - *External accounting service:* Needs reliable files in the agreed formats (CSV, ZIP, VeriFactu), without corrupted characters (NFR-2.6) and with clear versions (FR-6.3.2).
  - *Company (Product Owner):* Wants every export to be traceable and mass downloads to be detected (FR-6.4).
- **Preconditions:** The Administrator is authenticated and has export permissions.
- **Postconditions:** An export package or CSV data extract is available for download. Regenerated packages receive a new version identifier and visual marker (FR-6.3.2).
- **Success Guarantee:** The package or CSV file is generated in the selected format with exact amounts (NFR-2.5) and correct UTF-8 encoding (FR-6.11, NFR-2.6); metadata (timestamp, filters, requesting user) is recorded (FR-6.4.1); if it replaces a previous package, it has a new version identifier and visual marker (FR-6.3.2).
- **Minimal Guarantee:** A failed export does not modify the original invoice data.
- **Trigger:** The Administrator selects "Export accounting package" or "Export data (CSV)".
- **Main Success Scenario:**

1. **Administrator:** Requests to export an accounting package or CSV data.
2. **System:** Displays the available export options, including period (monthly/quarterly), supported format (CSV, ZIP, VeriFactu) (FR-6.11) and filters.
3. **Administrator:** Selects the options and confirms.
4. **System:** Starts the generation as a background task and shows its status (pending, processing, completed) (NFR-1.4).
5. **System:** Generates the package from issued invoices of the period.
6. **System:** Records the export metadata, including timestamp, applied filters and requesting user (FR-6.4.1). If the package is regenerated, it assigns a new version identifier and visual marker (FR-6.3.2).
7. **System:** Notifies the Administrator that the package is ready and makes it available for download.

- **Extensions:**
  - 3a. The package for that period already exists and data have changed (e.g., after UC-17):
    - 3a1. System generates a new version, marks it visually as "Regenerated – vN" (FR-6.3.2).

- 3b. Export classified as bulk/mass data export:
  - 3b1. System generates the package but automatically sends an alert to administrators (FR-6.4.2).
- 5a. No issued invoices in the selected period:
  - 5a1. System informs that there is nothing to export.
- 5b. Error during generation:
  - 5b1. System marks the task as “completed with errors” and keeps its status visible across browser sessions (NFR-1.4).
